MY THRESHOLDS GUIDELINE

1. Introduction

My Thresholds enables you to oversee your win/loss amount by setting up thresholds. This way, you can effectively control risks and make more informed decisions.

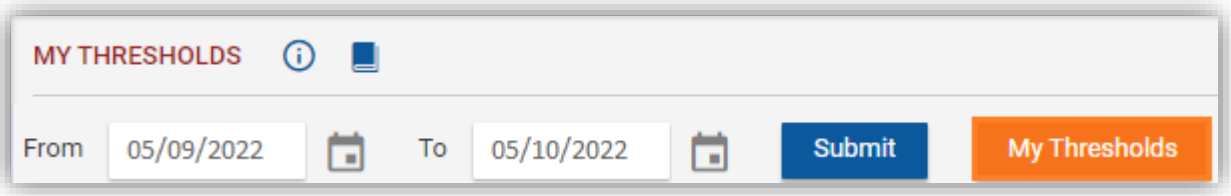

To access **My Thresholds**, go to **Main Menu > Risk Management > My Thresholds**

2. Set the thresholds

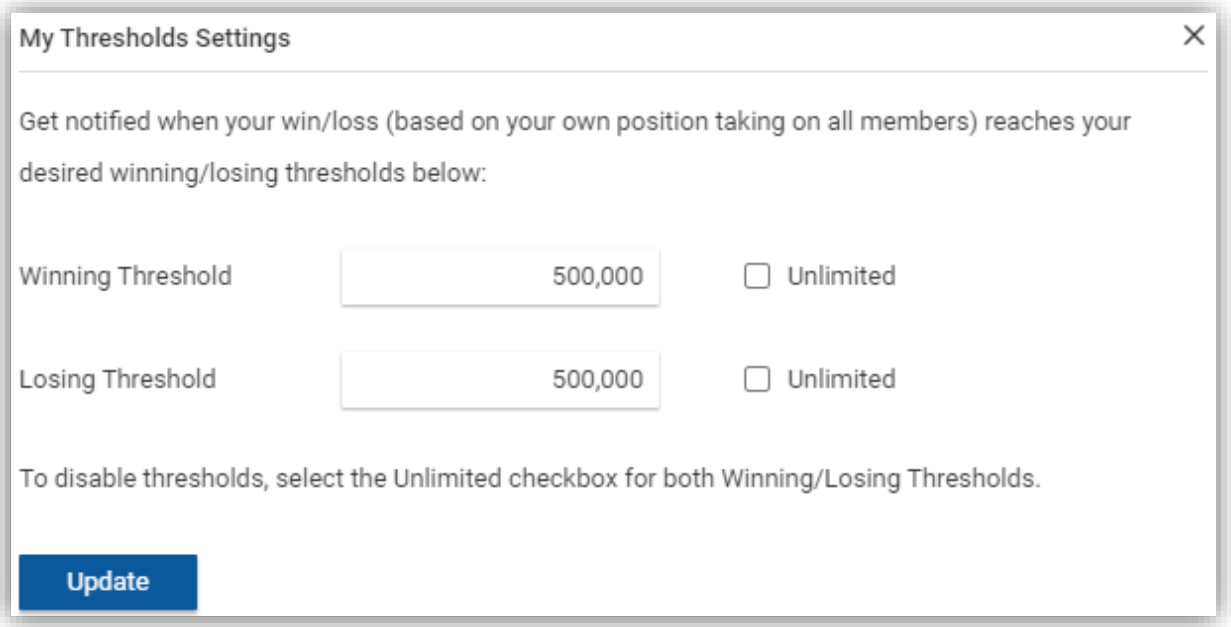

Threshold is a metric set to monitor when your win/loss amount is met or exceeded. Each time a Member wins or loses a bet, the win/loss amount (based on your position taking on all Members) will be accrued to **Accumulated Win Loss**, and when the accumulation reaches the thresholds, you will receive notifications via **Telegram.**

Accumulated Win Loss is reset to zero daily or when the function is turned off.

To set thresholds, go to **My Thresholds** and click **My Thresholds** button:

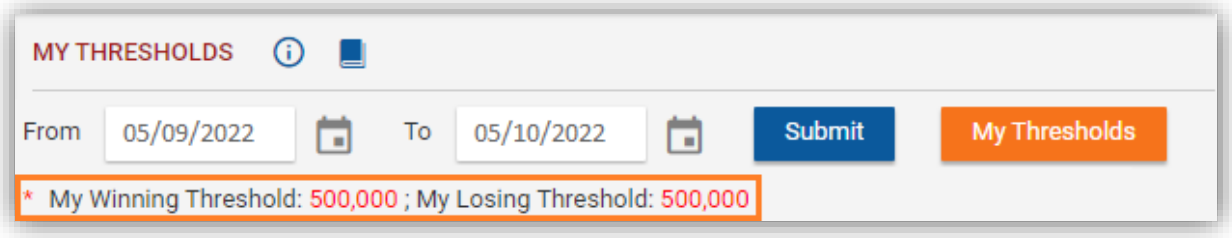

After that, you will see the **My Thresholds Settings** below:

Here is how to configure the My Thresholds:

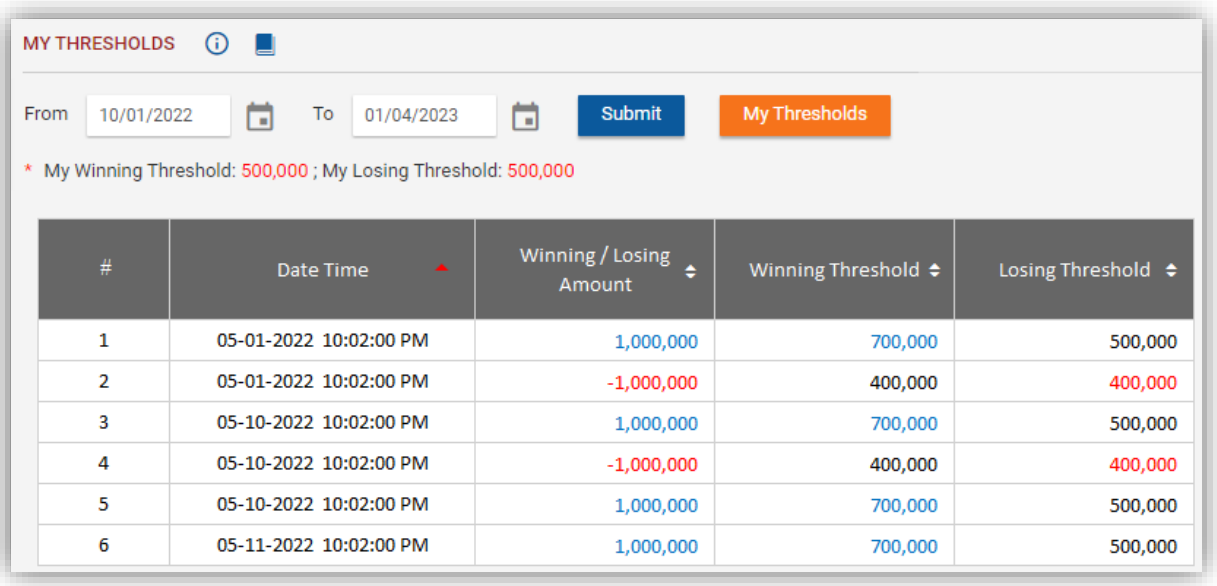

- **Winning Threshold (WT)**: a limited threshold set to notify you when your accumulated win amount reaches a certain point.
- **Losing Threshold (LT)**: a limited threshold set to notify you when your accumulated loss amount reaches a certain point.
- **Unlimited**: an unlimited threshold, selecting this means you ignore the threshold and do not receive notifications. Combining limited and unlimited thresholds will get you the following results:
  - **Unlimited WT + Unlimited LT**: ignore both Winning Threshold and Losing Threshold.
  - **Limited WT + Unlimited LT**: monitor Winning Threshold and ignore Losing Threshold.
  - **Unlimited WT + Limited LT**: ignore Winning Threshold and monitor Losing Threshold.

When finished, click **Update** and you will see your defined thresholds here:

3. Monitor your win/loss

When thresholds are set, if your win/loss amount (based on your position taking on all Members) reaches the thresholds, it will show up on **My Thresholds**:

- **Winning/Losing Amount**: the amount that you have gained/lost based on your position taking on all Members.
- **Winning Threshold**: the winning threshold value that you have set during which the threshold is reached.
- **Losing Threshold**: the losing threshold value that you have set during which the threshold is reached.
